ANIMAL STEM CELLS KEEP AMERICAN DREAM ALIVE

Distributorships Being Awarded for Breakthrough Treatment that Helps Dogs, Cats and Horses

NEW YORK—**MediVet-America** is awarding a limited number of distributorships for its major scientific advancement in **animal stem cell regenerative therapy** for pets and other animals suffering from osteoarthritis, hip dysplasia, ligament and cartilage injuries, and other degenerative diseases.

MediVet-America's new, drug-free **Adipose Stem Cell Procedure Kit** and equipment allows veterinary practitioner to now perform animal stem cell treatments entirely in their own clinics more quickly, effectively and economically compared to first generation animal stem cell therapy. The new procedure has been launched in the United States and Canada, where a total of \$68 billion is spent annually on pet care.

Stem cell therapy can lengthen and rejuvenate the quality of life for dogs, cats and horses experiencing arthritis, lameness, pain and a restricted range of motion. Previously, veterinarians were limited to prescribing anti-inflammatory medicine or performing expensive surgery such as hip replacements and other invasive procedures.

"As pet owners in the U.S. spend \$12 billion a year on vet bills alone—double the amount of 10 years ago—our distributors deliver cutting-edge technology to the doorstep of vets nationwide," said MediVet-America managing director **Jeremy Delk**. "It is an excellent opportunity for entrepreneurs in an expanding field. You don't need to be a rocket scientist to be selected as a MediVet distributor—you simply need the passion of an animal lover, and a will to succeed."

"With Americans caring for 170 million dogs and cats, this is a once in a lifetime opportunity to be part of the next generation of stem cell technology, a field that is exciting, rewarding and profitable," Delk said. "Thanks to a breakthrough treatment in the animal kingdom, the American dream is still alive in these tough times."

“Our business model allows ordinary people to immediately begin recouping investment with cash flow and profit,” Delk added. “It’s really a win-win-win. The distributor is able to quickly gain market share and residual income by selling the stem cell procedure kits to veterinarians; vets help more animals while achieving a long-term profit center for their practice; and pet owners can now afford a treatment that is far less expensive than the previous technology.

“MediVet has done all the hard work, literally putting years of scientific research in a box—the Adipose Stem Cell Procedure Kit—to supply to vets around the country,” Delk said. “With more and more money spent today on companion animals that are part of the family, MediVet’s technology allows distributors to work in local communities, serving vets who help pets live longer, healthier lives. The plan is simple—to help millions of animals and create partnerships with passionate distributors across America.”

“This new technology marks a significant milestone,” said MediVet-America spokesman **Dr. Mike Hutchinson, D.V.M.**, a leading practitioner in stem cell therapy who has performed more than 80 Adipose Stem Cell treatments on dogs and cats. “My independent research verifying MediVet’s superior results in stem cell count and activation has made me a staunch believer, and I’m excited to share this news with my colleagues.

“We are now able to bring the results of hundreds of millions of dollars of research directly into clinics for our companion animal patients,” Hutchinson said. “I believe adult stem cells and MediVet’s new application signifies the biggest breakthrough in veterinary medicine I have seen since entering the field 24 years ago.

“This cutting-edge technology is highly important to vet practitioners, because we’ve discovered that 65 percent of animals may benefit from stem cell regenerative therapy,” Hutchinson added.

Stem cell therapy for pets and other animals, such as those in the competitive performance equine market, first became available in the U.S. in 2003, but with expensive treatments, the procedure has been unaffordable for many. The Adipose Stem Cell Procedure kit costs a fraction of the old method, and can be performed by a trained technician in about three hours; the animal is under anesthesia for only a short time.
